

# PrEP use is not limited by sex or gender!

Pre-Exposure Prophylaxis is a tool in preventing HIV among sexually active people and those injecting drugs.

**PrEP is available in several forms,  
most of which are approved for those  
assigned female at birth**

Truvada and its generic form are the only oral medications approved for this group of people, but the injectable Cabenuva and the vaginal ring Dapivirine are also available for use.

# More about PrEP

PrEP typically has no side effects, although the most common involve nausea or other minor forms of gastrointestinal upset.

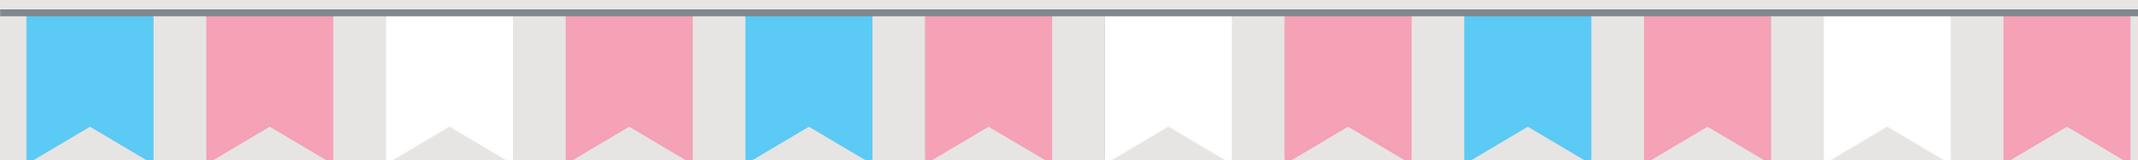

**PrEP can be up to 99% effective in preventing sexual transmission of HIV when taken daily**

PrEP does take longer to be effective in preventing HIV in penetrative sexual activities that are not anal sex.

PrEP becomes effective for anal sex around 7 days, while it can take up to three weeks to be as effective for other forms of sex.

**Truvada (& generic) is the most effective HIV prevention tool for those designated female at birth, but Cabenuva and Dapivirine still reduce risk by over 50 percent.**

# Online PrEP services are not exclusively for cis men.

**HeyMistr, QueerDoc, and Q Care Plus all offer telehealth services for PrEP prescribing and monitoring.**

While PrEP's initial studies were conducted in cis men who have sex with men, this medication is available for people of any and all genders.

Though mostly marketed towards cis men, this medication has been studied and is effective in all sexes and in people with differing hormone levels.

Truvada (& generic) are the most effective option for those having front hole or vaginal sex, and it's also effective for preventing HIV transmission from IV drug use.

# Trans masculine people who have sex with men can use PrEP

Pre-Exposure Prophylaxis  
can be up to 99% effective  
in preventing HIV

**PrEP can prevent transmission of HIV  
during any type of penetrative sex and  
with injectable drug use.**

Truvada and its generic form are the only oral medications approved for this group of people, but the injectable Cabenuva and the vaginal ring Dapivirine are also available for use.

# Did you know that PrEP works effectively for people on hormones?

PrEP has no impact to the efficacy of estrogen or testosterone treatments, although those on estrogen must be more strict if taking a daily pill for HIV prevention

**Testosterone use may actually increase HIV risk, making it necessary for those on it to look into new HIV prevention options.**

PrEP is recommended for anyone with a partner living with HIV, as well as those having sex with multiple partners or a partner with an unknown HIV status, as well as for people injecting drugs
